

Ideation Phase

Brainstorm & Idea Prioritization

Project Title	Script-Controlled ACL – Restrict Record Access Based on Field Value
Team ID	SWTID-2026-1695
Project Name	Skill Wallet

Step 1: Team Gathering, Collaboration and Select the Problem Statement

The team selected PS-1 — the need to restrict record access based on the record's own field value rather than the user's role alone.

Step 2: Brainstorm, Idea Listing and Grouping

- Idea A – UI Policies to hide fields on the form (rejected: only hides fields visually; does not block API/list access to the record)
- Idea B – Data Policies (rejected: enforces mandatory/read-only at field level; does not control record-level Create/Read/Write/Delete access)
- Idea C – Plain role-based ACL only (rejected: too coarse — cannot evaluate a field's value on the record)
- Idea D – Business Rule to abort the action (rejected: Business Rules are not the platform's dedicated security layer and do not integrate with the ACL engine used across UI, list, and API access)
- Idea E – Script-Controlled ACL with a condition script that checks the record's field value together with the user's role/department (selected)

Step 3: Idea Prioritization

Idea E (Script-Controlled ACL) was prioritized highest on both Importance and Feasibility because it is a native ServiceNow security feature, applies uniformly across UI/List/API access, and the same script pattern can be reused for Read, Create, Write, and Delete operations on the table.
