

Project Design Phase

Problem – Solution Fit

Project Title	Script-Controlled ACL – Restrict Record Access Based on Field Value
Team ID	SWTID-2026-1695
Project Name	Skill Wallet

Problem – Solution Fit Canvas

#	Canvas Element	Details for this Project
1	Customer Segment(s) (CS)	ServiceNow System Administrators and department users (e.g., HR, IT) who manage or use Skill Wallet Request records.
2	Jobs-to-be-Done / Problems (J&P)	Restrict who can Read, Create, Write, and Delete Skill Wallet Request records so that each department only accesses its own data.
3	Triggers (TR)	Compliance/audit review flags that users from one department can view or modify another department's records.
4	Emotions: Before / After (EM)	Before — concerned, exposed, distrustful of the access setup. After — confident and in control, knowing access is enforced automatically.
5	Available Solutions (AS)	Plain role-based ACL (too coarse), UI Policies (only hide fields visually), Data Policies (only control mandatory/read-only), manual record review (time-consuming, error-prone).
6	Customer Constraints (CC)	Must work natively inside the existing ServiceNow instance, with no extra license/tool cost and negligible performance overhead.
7	Behaviour (BE)	Administrators manually review record and role assignments; users request IT/Admin help when they cannot see a record they believe they should.
8	Channels of Behaviour (CH)	Online — ServiceNow platform itself (System Security > Access Control, Impersonate User for testing). Offline — compliance/policy review meetings.
9	Problem Root Cause (RC)	Native ServiceNow role-based ACLs only check whether a user holds a role — they do not evaluate the actual field value stored on the record.
10	Your Solution (SL)	Script-Controlled ACL on Read, Create, Write, and Delete that checks the record's Department field value against the logged-in user's department, granting full access only to the u_swt_admin role.
