

Project Design Phase

Proposed Solution

Project Title	Script-Controlled ACL – Restrict Record Access Based on Field Value
Team ID	SWTID-2026-1695
Project Name	Skill Wallet

Proposed Solution

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Role-based ACLs alone cannot restrict access based on a record's own field value (e.g., Department), risking cross-department exposure of Skill Wallet records.
2.	Idea / Solution Description	Implement Script-Controlled ACLs for Read, Create, Write, and Delete on the Skill Wallet Request table. Each ACL script checks the current record's Department field against the requesting user's department, and grants full access to users holding the u_swt_admin role.
3.	Novelty / Uniqueness	Unlike static role checks, the ACL condition is evaluated dynamically per record at runtime, using the record's own field value — the same access rule automatically adapts to every record without needing a separate ACL per department.
4.	Social Impact / Customer Satisfaction	Employees and department heads gain confidence that their skill/wallet data is only visible and editable by their own department or authorized admins, improving trust and compliance posture.
5.	Business Model (Revenue Model)	Delivered as a reusable configuration pattern within the ServiceNow instance — no license cost beyond the existing ServiceNow platform; reusable across other applications that need similar field-based restriction.
6.	Scalability of the Solution	The same script logic can be copied and adapted to any other table/field pair (e.g., restricting by Location or Project instead of Department) with minimal script changes.
