

Project Design Phase

Solution Architecture

Project Title	Script-Controlled ACL – Restrict Record Access Based on Field Value
Team ID	SWTID-2026-1695
Project Name	Skill Wallet

Solution Architecture

The solution architecture bridges the business problem (uncontrolled cross-department access) with the ServiceNow technical solution (Script-Controlled ACLs), organized into four layers:

- Presentation Layer – ServiceNow standard list and form views used to access Skill Wallet Request records
- Security Layer – Script-Controlled ACL records for Read, Create, Write, and Delete operations on u_skill_wallet_request, each running a GlideScript condition
- Application Logic Layer – The ACL condition script: checks gs.hasRole('u_swt_admin'); if false, looks up the requesting user's department via GlideRecord on sys_user and compares it to current.u_department
- Data Layer – Custom table u_skill_wallet_request storing Employee, Department, Skill Name, Wallet Points, and Status fields, plus the platform's sys_user and sys_user_role tables
